

House Construction, Design, and Systems Workshop

As a real estate/appraisal professional, knowledge of the “nuts and bolts” involved with where houses come from and what keeps them functioning is essential.

This course takes the numerous elements of basic home construction and attempts to give an overview of all the apparatus involved in modern housing construction projects. This course gives the real estate or appraisal professional a comprehensive, detailed synopsis of the many parts of the construction process from foundations to interiors, exteriors, plumbing and electricity. It also includes a review of environmental hazards that threaten neighborhoods and housing and offers insight into staying aware of these hidden dangers.

For beginners or seasoned professionals needing a refresher, this course covers site preparation, building tactics, building materials, environmental hazards and the installation of mechanical systems to give students a working knowledge of all the components of basic housing construction.
